

DSA Test

Remove duplicate number in sorted array:

The screenshot shows a code editor with a Java solution for removing duplicates in a sorted array. The code is as follows:

```
1 class Solution {
2     public int removeDuplicates(int[] nums) {
3         int n = nums.length;
4         for (int i = 0; i < n; i++) {
5             for (int j = i + 1; j < n; j++) {
6                 if (nums[i] == nums[j]) {
7                     for (int k = j; k < n - 1; k++) {
8                         nums[k] = nums[k + 1];
9                     }
10                    n--;
11                    j--;
12                }
13            }
14        }
15        return n;
16    }
17 }
```

The editor interface includes a top bar with icons for problem list, submit, and other tools. The code is saved, and the cursor is at line 3, column 29.

Merge sorted array :

The screenshot shows a code editor with a Java solution for merging two sorted arrays. The code is as follows:

```
1 class Solution {
2     public void merge(int[] nums1, int m, int[] nums2, int n) {
3         for (int i = 0; i < n; i++) {
4             nums1[m + i] = nums2[i];
5         }
6
7         for (int i = 0; i < m + n - 1; i++) {
8             for (int j = 0; j < m + n - i - 1; j++) {
9                 if (nums1[j] > nums1[j + 1]) {
10                    int temp = nums1[j];
11                    nums1[j] = nums1[j + 1];
12                    nums1[j + 1] = temp;
13                }
14            }
15        }
16    }
17 }
18 }
```

The editor interface includes a top bar with icons for problem list, submit, and other tools. The code is saved, and the cursor is at line 15, column 10.

Single number :

```
1 class Solution {
2     public int singleNumber(int[] nums) {
3         for (int i = 0; i < nums.length; i++) {
4             int count = 0;
5             for (int j = 0; j < nums.length; j++) {
6                 if (nums[i] == nums[j]) {
7                     count++;
8                 }
9             }
10            if (count == 1) {
11                return nums[i];
12            }
13        }
14        return -1;
15    }
16 }
```

Ln 15, Col 6

Move zero:

```
1 class Solution {
2     public void moveZeroes(int[] nums) {
3
4         int[] temp = new int[nums.length];
5         int index = 0;
6         for (int i = 0; i < nums.length; i++) {
7             if (nums[i] != 0) {
8                 temp[index] = nums[i];
9                 index++;
10            }
11        }
12        for (int i = 0; i < nums.length; i++) {
13            nums[i] = temp[i];
14        }
15    }
16 }
```
